

eMID 2.0

eMID 2.0
Mission Information Display

eMID 2.0 – Mission Information Display

eMID 2.0 – Mission Information Display is a web-enabled solution for displaying the incident data required by emergency service personnel in the station where they work. eMID 2.0 can be employed in wide-ranging situations thanks to its ability to display information on any device.

On larger screens it is possible to display additional elements, such as maps, alongside incident information. On smaller screens, such as tablets, just the relevant key information can be displayed.

In this way eMID 2.0 ensures that mission-critical incident information is readily available in vehicle depots, team areas or canteens.

EMID 2.0 AS A DISPLAY BOARD

eMID 2.0 can be used as a **station display board** to display incidents currently in progress.

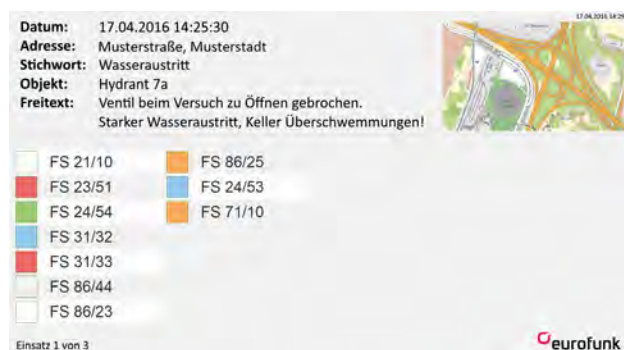

Fig. 1: eMID 2.0 – display example

EMID 2.0 AS A STATION-INDEPENDENT INFORMATION SYSTEM

eMID 2.0 can also be used as a **station-independent information system** in command vehicles or as a station PC.

An overview of all incidents (irrespective of station) is displayed in list form. The display format includes filter, sort and search capabilities.

LEADING-EDGE TECHNOLOGY

eMID 2.0 was designed for current web technologies. The web server in the control center receives its data from the incident management server via an encrypted file transfer connection. The use of "data diodes" or two-level safety gateways also safeguards the incident management network. Encryption of the information flow between the web server and the display terminals is also possible, if required.
